WHAT IS SELENISTART?

SELENISTART is a urea based nitrogen fertiliser with added selenium, which is an essential trace element for animals.

WHY USE SELENISTART?

- SELENISTART contains a vital trace element, selenium, which is required by all animals.
- The natural route for selenium intake by ruminant animals is from their green feed diet.
- The selenium in SELENISTART is a slow release granule which is the natural solution to boost low plant selenium levels.

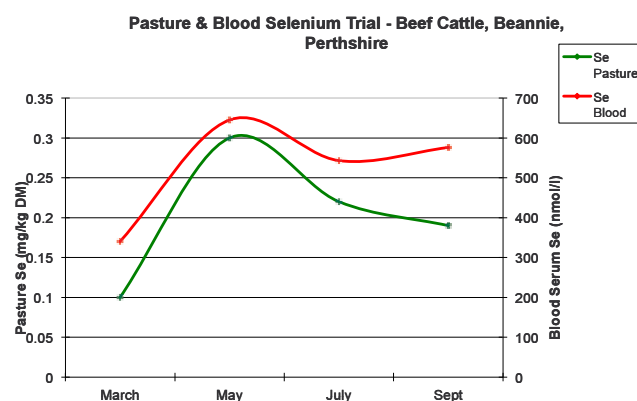

• This selenium is released throughout the plant growing cycle boosting the selenium content at harvest or during grazing.

FUNCTIONS OF SELENIUM

HELPS PREVENT

- Problems with fertility and retained placentas
- Ill thrift
- White muscle disease
- Mastitis

Trial showing the uptake of Selenium by grass and animal after Selenium is spread on pasture.

APPLICATION RATE

GRAZING

Applying a minimum of 4 bags/acre/year of SELENISTART over the grazing season will help to correct your selenium deficiency.

If the above amount of SELENISTART has not been spread, this product can be used in conjunction with SELENIGRASS (CAN+Se) as part of a programme whereby 4 bags/acre of either product or a combination of both are spread early in the grazing season.

SILAGE

SELENISTART can be used to replace granular urea for applications on silage crops. SELENISTART will help to raise the selenium content of the silage.
