

Objective: To examine the average yield increase of using AVAIL compared to other phosphates on a range of crops

Crop: Various

Location: Various

Date: 2008-2013

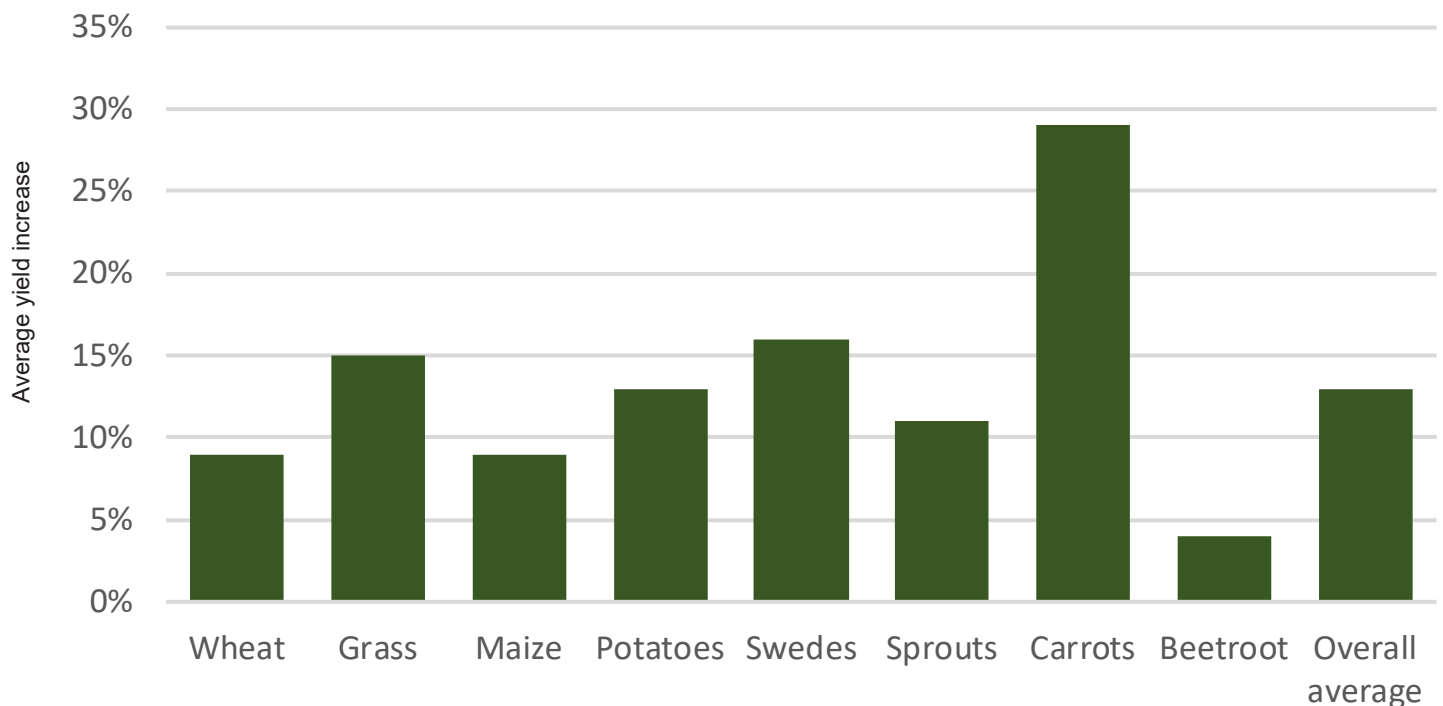

Researcher: Various

Trial code: Various

Results:

Over the last 15 years, many trials have compared the yield increases from using phosphate treated with AVAIL against untreated phosphate. The graph below shows the average yield increase for each.

Conclusions:

- In study after study, AVAIL has been shown to reduce phosphate fixation and boost potential yields by as much as 10-15%
